

# Release Plan

**Product Name: Collect**

**Team Name: Collect Team**

**Release Name: Collect 1.0**

**Revision Number: 1**

**Revision Date: June 30 2019**

## High Level Goals:

- Develop an iOS app that is:
- Able to split items on any receipt, including tax
- Able to split items among multiple people
- Able to share the individual transactions to people involved in the split

## User Stories:

- **Sprint 1:**
  - As a general user, I want to be able to convert physical receipts to virtual receipts, in case I misplace the receipt
  - Once the virtual receipt is generated, I want to be able to separate each item and its amount, as well as split any taxes and fees, so that I have an idea of the cost of each item
- **Sprint 2:**
  - Also as a general user, I want to be able to tell Collect the names of the people in the group I am splitting with
  - For each item, I want to assign it to each person in the group
  - Then, I want to have a high-level view of the mapping between item to person, so I can verify that the split has been computed correctly
- **Sprint 3:**
  - As a general user, I want to be able to send transactions out to people that I split with
  - Using the high-level view in Sprint 2, I want to be able to use some sort of sharing mechanism to send out a notification

- After the item has been paid for, I want to be able to mark that on the virtual receipt that Collect generated
- **Product Backlog:**
  - A user system so maybe payments can be done within the app itself, as opposed to using share sheets
  - Integration with other payment apps
  - Make Collect cross-platform (Android, Web)
- **Project Presentation:**
