

# **System and Unit Test Report**

**Product Name:** Collect

**By:** The Collective Team

**Last Modified:** 7/23/19

## **Testing Methodology:**

- Before pushing a change to the remote repository:
  - Team members would test the new feature using a selection of receipts they have saved for testing purposes.
- After confirming the feature to work with multiple receipts:
  - The feature is then considered ready for a second round of testing and is pushed to a branch on the remote repo.
- Then, the other team members can then pull the changes and test the feature themselves with their own collection of receipts.
  - If the feature worked on all of the receipts of two other members, then the feature was considered to be passing all tests.
- To ensure that the app is tested on a wide range of receipt formats:
  - Team members also continually tested the app if they obtained a receipt while shopping etc, regardless if a new feature was pushed at that time or not.
